

# POSITIVE POLYNOMIALS LECTURE NOTES

## (04: 22/04/10 - BEARBEITET 07/01/19)

SALMA KUHLMANN

### Contents

1. Exkurs in commutative algebra (continued)	1
2. Radical ideals and Real ideals	2
3. The Real Spectrum	5

### 1. EXKURS IN COMMUTATIVE ALGEBRA

**Recall 1.1.** Let  $K$  be a field and  $I$  an ideal of  $K[\underline{X}]$ , then the inclusion  $I \subseteq \mathcal{I}(\mathcal{Z}(I))$  is always true.

But in general it is false that

$$\mathcal{I}(\mathcal{Z}(I)) = I \tag{1}$$

**Note 1.2.** In other words we study the map

$$\begin{aligned} \mathcal{I} : \left\{ \text{algebraic sets in } K^n \right\} &\rightsquigarrow \left\{ \text{Ideals of } K[\underline{X}] \right\} \\ V &\longmapsto \mathcal{I}(V) \end{aligned}$$

- Clearly this map is 1-1 (proposition 2.5 of last lecture).
- What is the image of  $\mathcal{I}$  ? (2)

Let  $I$  an ideal,  $I = \mathcal{I}(V)$

$$\Rightarrow \mathcal{Z}(I) = \underbrace{\mathcal{Z}(\mathcal{I}(V))}_{\text{(prop. 2.5 of last lecture)}} = V$$

Thus an ideal  $I$  is in the image  $\Leftrightarrow I = \mathcal{I}(\mathcal{Z}(I))$

So studying the equality (1) amounts to studying (2).

## 2. RADICAL IDEALS AND REAL IDEALS

**Remark 2.1.** For an ideal  $I \subseteq K[\underline{X}]$ , answer to  $I = \mathcal{I}(\mathcal{Z}(I))$  is known

- when  $K$  is algebraically closed (Hilbert's Nullstellensatz),
- or
- when  $K$  is real closed (Real Nullstellensatz).

To formulate these two important theorems we need to introduce some terminology:

**Definition 2.2.** Let  $A$  be a commutative ring with 1,  $I \subseteq A$ ,  $I$  an ideal of  $A$ . Define

(i)  $\sqrt{I} := \{a \in A \mid \exists m \in \mathbb{N} \text{ s.t. } a^m \in I\}$ , the **radical** of  $I$ .

(ii)  $\sqrt[\mathbb{R}]{I} := \{a \in A \mid \exists m \in \mathbb{N} \text{ and } \sigma \in \Sigma A^2 \text{ s.t. } a^{2m} + \sigma \in I\}$ , the **real radical** of  $I$ .

**Remark 2.3.** It follows from the definition that  $I \subseteq \sqrt{I} \subseteq \sqrt[\mathbb{R}]{I}$ .

**Definition 2.4.** Let  $I$  be an ideal of  $A$ . Then

(1)  $I$  is called **radical ideal** if  $I = \sqrt{I}$ , and

(2)  $I$  is called **real radical ideal** (or just **real ideal**) if  $I = \sqrt[\mathbb{R}]{I}$ .

**Remark 2.5.** (i) Every prime ideal is radical, but the converse does not hold in general.

(ii)  $I$  real radical  $\Rightarrow I$  radical (follows from Remark 2.3 and Definition 2.4).

**Proposition 2.6.** Let  $A$  be a commutative ring with 1,  $I \subseteq A$  an ideal. Then

(1)  $I$  is radical  $\Leftrightarrow \forall a \in A : a^2 \in I \Rightarrow a \in I$

(2)  $I$  is real radical  $\Leftrightarrow$  for  $k \in \mathbb{N}, \forall a_1, \dots, a_k \in A : \sum_{i=1}^k a_i^2 \in I \Rightarrow a_1 \in I$ .

*Proof.* (1) ( $\Rightarrow$ ) Trivially follows from definition.

( $\Leftarrow$ ) Let  $a \in \sqrt{I}$ , then  $\exists m \geq 1$  s.t.  $a^m \in I$ .

Let  $k$  (big enough) s.t.  $2^k \geq m$ , then

$$a^{2^k} = a^m a^{2^k - m} \in I$$

Now we show by induction on  $k$  that:

$$[a^2 \in I \Rightarrow a \in I] \Rightarrow [a^{2^k} \in I \Rightarrow a \in I]$$

For  $k = 1$ , it is clear.

Assume it true for  $k$  and show it true for  $k + 1$ , i.e. let  $a^{2^{k+1}} \in I$ , then

$$a^{2^{k+1}} = \left(a^{2^k}\right)^2 \in I \quad \underbrace{\Rightarrow}_{\text{(by assumption)}} \quad a^{2^k} \in I \quad \underbrace{\Rightarrow}_{\text{(induction hypothesis)}} \quad a \in I.$$

(2) ( $\Rightarrow$ ) Trivially follows from definition.

( $\Leftarrow$ ) Let  $a \in \sqrt[m]{I}$ , then  $\exists m \geq 1$ ,  $\sigma = \sum a_i^2 \in \Sigma A^2$  s.t.  $a^{2m} + \sigma \in I$ .

$$\Rightarrow (a^m)^2 + \sigma \in I \quad \underbrace{\Rightarrow}_{\text{(by assumption)}} \quad a^m \in I \quad \underbrace{\Rightarrow}_{\text{(as above in (1))}} \quad a \in I. \quad \square$$

**Remark 2.7.** (i) Since real radical ideal  $\Rightarrow$  radical ideal, so in particular (2)  $\Rightarrow$  (1) in above proposition.

(ii) A prime ideal is always radical (as in Remark 2.5), but need not be real.

**Proposition 2.8.** Let  $\mathfrak{p} \subseteq A$  be a prime ideal. Then  $\mathfrak{p}$  is real  $\Leftrightarrow ff(A/\mathfrak{p})$  is a real field.

*Proof.*  $\mathfrak{p}$  is not real

$$\Leftrightarrow \exists a, a_1, \dots, a_k \in A; a \notin \mathfrak{p} \text{ such that } a^2 + \sum_{i=1}^k a_i^2 \in \mathfrak{p}$$

$$\Leftrightarrow \bar{a}^2 + \sum_{i=1}^k \bar{a}_i^2 = 0 \text{ and } \bar{a} \neq 0 \text{ (in } A/\mathfrak{p})$$

$$\Leftrightarrow ff(A/\mathfrak{p}) \text{ is not real.} \quad \square$$

**Theorem 2.9.** Let  $K$  be a field,  $A = K[\underline{X}]$ ,  $I \subseteq A$  an ideal. Then

(1) (Hilbert's Nullstellensatz) Assume  $K$  is algebraically closed, then

$$\mathcal{I}(\mathcal{Z}(I)) = \sqrt{I}.$$

(Proved in B5)

(2) (Real Nullstellensatz) Assume  $K$  is real closed, then

$$\mathcal{I}(\mathcal{Z}(I)) = \sqrt[\mathbb{R}]{I}.$$

(Will be deduced from Positivstellensatz)

**Corollary 2.10.** Consider the map:

$$\mathcal{I} : \left\{ \text{algebraic sets in } K^n \right\} \longrightarrow \left\{ \text{Ideals of } K[\underline{X}] \right\}$$

(1) If  $K$  is algebraically closed, then

$$\text{Image } \mathcal{I} = \{I \mid I \text{ is a radical ideal}\}$$

(2) If  $K$  is real closed, then

$$\text{Image } \mathcal{I} = \{I \mid I \text{ is real ideal}\}$$

□

Now we want to deduce the Real Nullstellensatz [Theorem 2.9 (2)] from part (3) of the Positivstellensatz (PSS) [Theorem 1.1 of last lecture].

We need the following 2 (helping) lemmas:

**Lemma 2.11.** Let  $A$  be a commutative ring and  $M$  be a quadratic module, then:

(1)  $M \cap (-M)$  is an ideal of  $A$ .

(2) The following are equivalent for  $a \in A$ :

(i)  $a \in \sqrt{M \cap (-M)}$

(ii)  $a^{2m} \in M \cap (-M)$  for some  $m \in \mathbb{N}, m \geq 1$

(iii)  $-a^{2m} \in M$  for some  $m \in \mathbb{N}, m \geq 1$ .

□

**Lemma 2.12.** Let  $A$  be a ring,  $M(= M_S)$  a quadratic module (resp. preordering) of  $A$  generated by  $S = \{g_1, \dots, g_s\}; g_1, \dots, g_s \in A$ . Let  $I$  be an ideal in  $A$  generated by  $h_1, \dots, h_t$ , i.e.  $I = \langle h_1, \dots, h_t \rangle; h_1, \dots, h_t \in A$ . Then  $M + I$  is the quadratic module (resp. the preordering) generated by  $S \cup \{\pm h_i; i = 1, \dots, t\}$ . □

**Recall 2.13.** [(3) of PSS ] Let  $A = \mathbb{R}[\underline{X}]$ ,  $S = \{g_1, \dots, g_s\} \subseteq \mathbb{R}[\underline{X}]$ ,  $f \in \mathbb{R}[\underline{X}]$ . Then  $f = 0$  on  $K_S \Leftrightarrow \exists m \in \mathbb{Z}_+$  s.t.  $-f^{2m} \in T_S$ .

**Corollary 2.14.** (to Recall 2.13 and Lemma 2.11) Let  $K = K_S \subseteq \mathbb{R}^n$ ,  $T = T_S \subseteq \mathbb{R}[\underline{X}]$  (as in PSS), then

$$\mathcal{I}(K_S) = \sqrt{T_S \cap (-T_S)}.$$

*Proof.*  $f = 0$  on  $K_S \Leftrightarrow -f^{2m} \in T_S$  for some  $m \in \mathbb{Z}_+$   
 (by(3) of PSS)  
 $\Leftrightarrow f \in \sqrt{T_S \cap (-T_S)}$  □  
 (by lemma 2.11)

**Corollary 2.15.** (to Lemma 2.11) Let  $A$  be a commutative ring with 1. Let  $I$  be an ideal of  $A$ . Consider the preordering  $T := \Sigma A^2 + I$ , then

$$\sqrt[\mathbb{R}]{I} = \sqrt{T \cap (-T)}. \quad \square$$

Now Corollary 2.14 and Corollary 2.15 give the proof of the Real Nullstellensatz (RNSS) as follows:

*Proof of RNSS* [Theorem 2.9 (2)]. Let  $I$  be an ideal of  $\mathbb{R}[\underline{X}]$

We show that:  $\mathcal{I}(\mathcal{Z}(I)) = \sqrt[\mathbb{R}]{I}$

$\mathbb{R}[\underline{X}]$  Noetherian  $\Rightarrow I = \langle h_1, \dots, h_t \rangle$  (by Hilbert Basis Theorem) .

Consider  $S := \{\pm h_i ; i = 1, \dots, t\}$

Then  $K_S = \mathcal{Z}(I)$  [clearly]

Now by Lemma 2.12, we have:

$$T = T_S = \Sigma \mathbb{R}[\underline{X}]^2 + I$$

So we get,

$$\mathcal{I}(\mathcal{Z}(I)) = \mathcal{I}(K_S) \underset{\text{(Cor 2.14)}}{=} \sqrt{T \cap (-T)} \underset{\text{(Cor 2.15)}}{=} \sqrt[\mathbb{R}]{I} \quad \square$$

### 3. THE REAL SPECTRUM

**Definition 3.1.** Let  $A$  be a commutative ring with 1. Then:

$\text{Spec}(A) := \{ \mathfrak{p} \mid \mathfrak{p} \text{ is prime ideal of } A \}$  is called the **Spectrum** of  $A$ .

$\mathcal{Sper}(A) = \mathcal{Spec}_r(A) := \left\{ (\mathfrak{p}, \leq) \mid \mathfrak{p} \text{ is a prime ideal of } A \text{ and } \leq \text{ is an ordering on the (formally real) field } ff(A/\mathfrak{p}) \right\}$  is called the **Real Spectrum** of  $A$ .

**Remark 3.2.** (i) Several orderings may be defined on  $ff(A/\mathfrak{p})$ ,  
 $(\mathfrak{p}, \leq_1) \neq (\mathfrak{p}, \leq_2)$ .

(ii)  $(\mathfrak{p}, \leq) \in \mathcal{Sper}(A) \Rightarrow \mathfrak{p}$  is real radical ideal. [see Proposition 2.8 and Remark 2.5 (i).]

**Note 3.3.**  $\mathcal{Sper}(A) := \{ \alpha = (\mathfrak{p}, \leq) \mid \mathfrak{p} \text{ is a real prime and } \leq \text{ an ordering on } ff(A/\mathfrak{p}) \}$ .
